Anthony Edens

DEVOPS MANAGER · PLATFORM · SECURITY · HEALTHCARE SAAS
github.com/tedens · tedens.github.io/devops-portfolio

PROFESSIONAL SUMMARY

DevOps and platform-engineering leader with 14 years spanning systems administration, software development, and cloud operations; currently owning the DevOps, platform, and security functions for a healthcare SaaS platform serving ~4.5M API requests a day across six environments. Deep hands-on expertise in Kubernetes, AWS, infrastructure-as-code, GitOps, and observability, with a record of high-availability systems, major cost reduction, and infrastructure built to HIPAA controls with SOC 2 Type I readiness. Builds and open-sources platform tooling in Go, including a PHI-scrubbing OpenTelemetry pipeline for healthcare workloads.

EXPERIENCE

DevOps Manager Claimocity — 2023 - Present

Healthcare revenue-cycle-management and physician-workflow SaaS platform.

- Own the DevOps, platform, and security functions for a 10-engineer organization, reporting to the CTO and President; set the department's quarterly roadmap with the President, COO, and CTO, and maintain accountability for cloud spend.
- Architected and now operate the production Kubernetes (EKS) platform on AWS, sustaining 99.993% uptime on the highest-traffic production app (Oct 2025 to Oct 2026); pinned CoreDNS and critical infrastructure to on-demand nodes and added PodDisruptionBudgets.
- Reduced overall cloud spend ~38% through rightsizing, Karpenter spot provisioning with tuned disruption budgets, reserved-instance planning, decommissioning of unused VPCs and VPNs, and tag-based cost attribution.
- Led the migration of API deployments off Jenkins to GitOps delivery (Argo CD, Argo Rollouts, Kargo, GitHub Actions) with a single shared Helm chart, approver-gated promotion and hotfix lanes, and immutable per-commit image tags for audit-grade traceability; lower environments deploy multiple times a day and production API services release weekly.
- Standardized infrastructure on Terraform/Terragrunt and Helm, including major-version upgrades of EKS, PostgreSQL, and ElastiCache across every environment; centralized secrets in HashiCorp Vault and 1Password Connect.
- Own the security and compliance program: HIPAA controls, SOC 2 Type I readiness and remediation, vulnerability and supply-chain response (CVE patch cadence, npm/PyPI package audits, GitHub Actions OIDC hardening), IMDS hardening, credential and encryption-key rotation, and penetration-test cycles.
- Built end-to-end observability (Grafana, Prometheus with long-term storage, Elasticsearch) and added OpenTelemetry distributed tracing across the Node.js APIs, p99 latency tracking, and MongoDB query-context tagging and audit logging, backed by proactive alerting and on-call runbooks.
- Deliver hospital and EHR integrations: IPsec VPN tunnels and HL7 relay hosts for partner health systems, SFTP partner onboarding, and an HL7 v2.7 parser.
- Mentor engineering teams on secure development, cloud cost, and platform best practices.

DevOps Engineer Capstan — 2021 - 2023

Early-stage startup building AI voice agents to automate insurance phone calls.

- Coordinated two project teams (12 developers) as technical lead and project manager, shipping two AI MVPs for automated insurance calling that saved agents ~45 minutes of hold time per call in production.
- Built an IVR-navigation bot that dials insurance carriers and works through their phone menus, plus a voice-detection service (94% accuracy on live calls) that connects a live agent the moment a person picks up.
- Built and ran the deployment pipeline and infrastructure behind both products.

DevOps Engineer AC Moore — 2018 - 2020

E-commerce retailer operating physical stores and an online storefront.

- Managed content, infrastructure, and CI/CD deployments (Jenkins, GitLab) for the company's web and mobile e-commerce applications.
- Operated the warehouse infrastructure and warehouse-management software (WMS) supporting fulfillment.
- Drove the technical knowledge transfer that supported the company's acquisition.

Linux Systems Administrator / Developer SingleHop — 2016 - 2018

- Maintained the account and server provisioning process, handling VEEAM backups and hypervisor management across the fleet.
- Deployed 75+ microservices and automated configuration management with SaltStack and Ansible.

Linux Systems Administrator / Developer **InMotion Hosting** **2012 - 2016**

- Advanced from technical support to Linux systems administration over three years, monitoring 3,000+ servers across shared and dedicated hosting.
- Moved into development as a Joomla / PHP developer, building web applications and authoring advanced customer-facing technical articles for the support forums.

SELECTED PROJECTS

Open source at github.com/tedens. Each project ships with an end-to-end drill that demonstrates the property it claims, plus a negative control that shows the drill can fail.

PHI-Safe Telemetry Pipeline

github.com/tedens/phi-telemetry

Custom OpenTelemetry Collector processor in Go that scrubs PHI (MRNs, SSNs, dates of birth, member IDs, emails, phone numbers, addresses) and credentials from traces, logs, and metrics before they leave the node. Helm chart for EKS with TLS 1.3 on every hop and agent-to-gateway mTLS. A leak drill plants synthetic PHI and searches every backend, then disables redaction and confirms the same search finds every injected identifier.

Compliance as Code

devops-portfolio / 15-compliance-as-code

A selected set of HIPAA and SOC 2 technical controls expressed as OPA/Rego policy (Conftest, Trivy), gated on every change, with expiring exceptions and a dated evidence trail. Runs against the portfolio's own infrastructure, so findings are real.

Supply Chain Security

devops-portfolio / 17-supply-chain

Every build signed with the workflow's OIDC identity (cosign / Sigstore), SBOM and SLSA provenance attached, and a Kyverno admission controller that refuses anything not signed by that identity and built from that repository.

GitOps Delivery

devops-portfolio / 16-gitops-delivery

Argo CD syncs the repository, Argo Rollouts runs a canary gated on Prometheus AnalysisTemplates, and a build that fails its measurements rolls itself back. The drill runs in CI.

TECHNICAL SKILLS

Cloud & IaC AWS (EKS, RDS, ElastiCache, IAM) Terraform / Terragrunt Helm Karpenter

CI/CD & GitOps GitHub Actions Argo CD Argo Workflows Argo Rollouts Kargo Jenkins GitLab

Observability OpenTelemetry (Collector, custom processors) Grafana Prometheus Alertmanager Loki Tempo Elasticsearch

Data PostgreSQL Redis MongoDB Atlas

Security HashiCorp Vault 1Password Teleport Trivy Kyverno OPA / Conftest penetration-test coordination

Supply Chain & Compliance cosign / Sigstore SLSA provenance SBOM HIPAA controls SOC 2 controls

Identity & Networking Microsoft Entra ID (SSO / SCIM) VPC / Transit Gateway IPsec VPN HL7 integrations cert-manager TLS / mTLS

Languages & Runtimes Go Python Node.js / TypeScript
